

How MotionSteel saves 50% more time and boosts bid volume with LIFT

MotionSteel faced inefficiencies and unintended omissions, often completing take-offs on the day-of. With LIFT's cutting-edge software, they revolutionized their estimation process and operations.

Our Solution

Our AI-powered take-off tool, LIFT, generates an automated Bill of Materials (B.O.M) in minutes. By extracting data from their blueprints, MotionSteel increased the speed and accuracy of their estimates, increased project awards, and overall operational improvement.

Enhanced Productivity

With LIFT, MotionSteel has freed up **40 to 50 percent** of their team's time, enabling better reviews and more effective process management.

Improved Efficiency

MotionSteel **boosted project volume** and streamlined operations by having project managers and coordinators handle both estimates and management seamlessly.

Reduced Errors

LIFT enables MotionSteel to swiftly upload and process blueprint drawings, **minimizing the overwhelm** of extensive pages, and highlights uncertainties for easy identification and correction.

"It was a no brainer. I've been estimating for probably 8 years using just the good ol' highlighter and paper, wishing for a program that could automate this process. LIFT frees up more time for your employees to do a better job and better review. With LIFT, we went from doing roughly 30 to 40 estimates a month to hitting 70 monthly."
